Abstract (en)

[origin: WO2010017862A1] The invention relates to a table with a pivotable table top (2) which is mounted rotatably and lockably about an axis of rotation extending in its longitudinal direction by means of a pivoting mechanism (10) on a table frame in the upper region of two lateral table legs (3) and can be folded out or folded in between a horizontal use position and a folded-in storage position. A pivoting movement of the table top is achieved, while combining secure operation and simple handling, in that the pivoting mechanism (10) comprises at least one pair of inter-engaging, mutually complementary tooth portions (15, 17) which are arranged concentrically to the axis of rotation and which can be moved apart relative to one another by at least the tooth depth in the direction of the axis of rotation in order to enable the pivoting movement, and in that for each pair one tooth portion (15) is mounted fixedly in terms of rotation with respect to the table leg (3) and the other tooth section (17) is mounted fixedly in terms of rotation with respect to the table top (2).
