Abstract (en)
[origin: EP2330071A2] The closure (V) has an upper part (O) is rotatably driven by a closure-drive motor (M) and supports a closure element (E). A container carrier (7) driven at a lower part (U) by the motor for transportation of a container (B). The upper part is height-adjustable relative to the lower part by the motor for adjusting different heights of the container. A coupling system (K) is alternatively switched between a drive function and an upper part-height adjusting function. The drive motor is designed as a transmission servo-motor.
