Abstract (en)  
[origin: WO2010037529A1] A multi-compartment slide and shell container (2) comprises: an outer shell (4); and an inner slide (6) having a first compartment (38) with a first access opening and a second compartment (40) with a second access opening. The inner slide (6) is slidable within the outer shell (4) between a closed position in which the first and second access openings are occluded by the outer shell (4) such that the interiors of the first (38) and second (40) compartments are inaccessible and an open position in which the interiors of the first (38) and second (40) compartments are both accessible. In the open position, the second access opening of the inner slide (6) is substantially aligned with a third access opening (20) provided in the outer shell (4) such that the second compartment (40) of the inner slide (6) is accessible through the second and third (20) access openings. The inner slide (6) may be slidable within the outer shell (4) between the closed position and the open position via an intermediate position in which the interior of one of the first (38) and second (40) compartments is inaccessible and the interior of the other of the first (38) and second (40) compartments is accessible.
