Abstract (en)

[origin: EP2332804A1] The method involves loading a portable computer (4) with projection data for a point e.g. starting point (I) and stop point (II), on a path to be tested, and coupling the computer with a mobile magnetic activation antenna (1) and a mobile magnetic receiving antenna (2) for transmitting telegrams (9) from balises (6) to the computer. The data is compared with the received telegrams, and correct installation of the telegrams is determined when the data and the telegrams match with each other for determining coincidence of the point with projection recorded for the point. An independent claim is also included for a portable computer comprising a peripheral terminal connected with a mobile magnetic antenna for receiving balise telegrams.
