Abstract (en)
[origin: EP2332870A1] The seal has flexible lateral frame parts (3, 4) including lateral skirts (5, 6) and a flexible horizontal upper seal (7). An upper skirt (8) is arranged in the horizontal upper seal and suspended downward in a resting state. Connecting rods (9, 10) are provided in an upper area of each frame part and connect a front-lateral end of the frame parts with a building wall (2). The front-lateral end supports a connection profile (12) that is non-rigidly attached to an upper transverse bar (14), where the connection profile is oppositely moved to a side of the transverse bar. The upper transverse bar is designed as a hollow section.
