Abstract (en)  
[origin: EP2333188A1] The present invention relates to a screen structure comprising a first structure element, such as a roof structure beam (1) with angle of inclination ( $\theta$ ), and a second structure element (2), such as a gutter profiled section (2), which is connected to the first structure element (1) by means of a hinge connection (8, 9) that permits the connected structure elements (1), (2) to rotate with respect to one another, so as to change the angle of inclination ( $\theta$ ), while the hinge connection also permits the connected structure elements (1), (2) to be moved in translation with respect to one another in at least two different translational directions (T 1 ), (T 2 ). As a result, the position of the structure elements with respect to one another can be changed even after they have been connected, for example in order to correct dimensional tolerances. This makes installation easier and quicker.
