Abstract (en)
[origin: WO2010034629A1] The invention relates to a saw horse having at least two stand elements, wherein each stand element (1) comprises a base (4) and two vertical braces (2) leaving in each case between themselves an intermediate space (5) for accommodating wood (21) to be sawed or the like and protruding upward from the base (4), wherein one vertical brace (2) of one stand element (1) is connected to a vertical brace (2) of the other stand element (1) by way of a connecting element (6) such that the intermediate spaces (5) of the two stand elements (1) are aligned with each other in an operating position in which the connecting elements (6) run parallel to each other. In order to achieve a refinement that is advantageous for use, it is proposed that the connecting elements (6) are attached rotatably to the vertical braces (2) such that the saw horse can be folded from the operating position thereof, in which the connecting elements (6) are arranged at the maximum distance from each other, in a parallelogram-like manner into a storage position, in which the connecting elements (6) are arranged at the minimum distance from each other.
