Abstract (en)

[origin: WO2010029063A1] The invention relates to a system for use in a motor vehicle, wherein the system comprises a navigation system and a control unit and the control unit is designed in such a way that, using a list of goods stored in the control unit, a route of stops for purchasing the goods which can be depicted by the navigation system is produced. Furthermore, a near-field receiver and/or near-field transponder for detecting goods is present in the motor vehicle and can be or is connected to the control unit in such a way that an additional list having detected goods can be transmitted to the control unit and the stored list can be updated by means of the additional list. A dynamic examination and possibly a dynamic adaptation of the route for purchasing the various goods depicted in the navigation system are thus possible.
