Abstract (en)  
[origin: EP2335997A1] The system (10) has a communication system (34) arranged such that communication is carried out in unidirection from a leading trolley (16) to a trailing trolley. A signal transmission device (36) is attached to the leading trolley and transmits a signal for a condition of preset movement parameters of the leading trolley. A signal receiving device (38) is attached to the trailing trolley and cooperates with the signal transmission device of the leading trolley. The transmission device produces a 1-bit signal and indicates different conditions of the parameters of the leading trolley.
