Abstract (en)
[origin: DE102005001419B3] The regulator has a jet division mechanism (2), allowing water to flow into a multiplicity of single jets. A single jet is provided on a junction (3) and has crossing lattice bars (4, 5) forming a grid network and laterally connected at the outlet side (6). The junction is arranged as inflow of the grid network (6). The nozzle is a ventilated nozzle (1) with a nozzle housing (7) with an opening (8) provided. Inside the housing a part is provided for keeping the water jet away from the ventilation opening. The grid network is arranged as a plate. The lattice bars inflow-laterally within the range of their individual junctions (9) and are longitudinal or edge-laterally rounded or tapered.
