Abstract (en)

[origin: EP2336470A2] The door-closer (20) has a mechanical connection system interposed between an electromagnetic retaining part and a hydraulic damping return part. The system has cams (10, 10') that are provided with contact areas and hook areas and are movable in rotation around corresponding axes. The axes of the cams are located on an intermediate case (8) that is movable in translation by screwing/unscrewing along a longitudinal central axis with respect to the retaining part and/or the return part.
