Abstract (en)

[origin: WO2010046841A1] The present invention is characterized in that the support part, which is arranged in one or several angles, can carry out its generally intended support function when in the normal state, but additionally can lose its original support behavior required for satisfactory serviceability in cases of exceptional load involving shaking and vibrating (e.g. earthquakes), and as such can receive another static function and fully fulfill said function (tension-compression member function).
