Abstract (en)

[origin: WO2010031576A1] The invention relates to a method for calibrating a sensor designed to check value documents. The sensor records measurement signals of a calibration medium transported past the sensor. From the recorded measurement signals, reference data of the calibration medium are determined, and also a transport property of the calibration medium is determined, e.g. the transport speed or the transport position of the calibration medium. At least one correction value is determined from the transport property. Said correction value is used to correct the recorded reference data of the calibration medium. Following the calibration, the corrected reference data are compared with target data of the calibration medium. The sensor is then optionally adjusted using the corrected reference data.
