Abstract (en)

[origin: EP2338817A2] In a paper leaves processor, when a paper leaf is introduced in a storing direction, a sensor (1b) detects a position of the paper leaf in a direction of a width of a take-up roller (1a). A correction amount-calculating unit (1c) compares the position of the paper leaf detected by the sensor and a centering area of an inlet-outlet opening, and calculates a correction amount for accommodating the position of the paper leaf within a centering area when discharging the paper leaf. Further, the correction amount-calculating unit calculates a movement amount of the take-up roller based on a moving direction of the take-up roller and the correction amount, and stores the movement amount in a correction information-storing unit (1d). When discharging the paper leaf, a position controller controls a moving unit (1f) based on the movement amount to move a position of the take-up roller.
