Abstract (en)

[origin: WO2010037670A1] Fuel cells known from the prior art include full-ceramic high-temperature fuel cells in particular, wherein a cathode-side ceramic substrate is the support for the solid electrolytes and the electrodes. According to the invention, a metal substrate (10, 20, 40, 50) is provided as a support for the functional layers, wherein the metal substrate is porous for allowing reactants and reaction products to flow therethrough. A fuel cell system constructed of said fuel cells is suitable for operation at lower operating temperatures, in particular at temperatures of between 500 and 700°C. The novel fuel cells can be manufactured using comparatively simple powder-metallurgical methods.
