Abstract (en)

[origin: EP2343425A1] The assembly (4) has two homogeneous rail segments (5, 6) arranged along a longitudinal axis (2) and partially overlapped with each other. A guiding unit is formed such that the rail segments are guided and relatively adjusted to each other under change of a mutual axial lap along the longitudinal axis of the assembly, where length of the assembly is changed by the guiding unit. The mutual axial lap of the rail segments is loosely alterable. The guiding unit is formed with a slotted hole (13) for one of the rail segments. An independent claim is also included for a fitting arrangement for a window, a door and a flap.
