Abstract (en)

[origin: WO2010044715A1] The invention concerns an absorbent article, in particular a diaper. The rear portion thereof comprises a pair of elastic side panels attached to opposing longitudinal edges thereof. The front portion of the article comprises at least two landing zones upon which the elastic side panels overlap when the article is fastened. An area of the front portion located at least around each landing zone comprises a plurality of first indicia in a first pattern. Each of said elastic side panels also comprises a plurality of second indicia in a second pattern. The distance between adjacent second indicia comprising the second pattern increases as the elastic side panel is stretched. When the elastic side panels are stretched by a predetermined force - the second pattern on the elastic side panels matches the first pattern around each landing zone.
