Abstract (en)

[origin: WO2010057603A2] The invention relates to a heat exchanger for transferring heat from a heating medium, particularly the exhaust flow of an internal combustion engine, to a working medium that evaporates in the heat exchanger, comprising an alternating stacking sequence of guiding layers for the heating medium and guiding layers for the working medium; in which the heating medium and the working medium are guided in cross counter flow; wherein each guiding layer for the working medium comprises a channel plate that exhibits at least one meandering through-hole and wherein cover plates are arranged on both sides of the channel plate that seal the through-hole laterally except for one inlet and one outlet, forming a working medium channel, wherein the channel plate is connected to the cover plates by a firm bond; and wherein the working medium channel comprises a first section originating from the inlet, said first section having a first free cross-section, and a second section flowing into the outlet, said second section having a second free cross-section that is wider than the first free cross-section.
