Abstract (en)
[origin: EP2347673A1] The method involves provided a head piece (14) with a small supporting plate that supports the bristles, where the support plate is fixed to the head piece by welding and then a force is exerted on a tooth brush body. A neck piece (32) and the head piece from the original shape are bent relative to each other around a predetermined angle (Alpha) by the force in warm state of a welded zone (51). The force is removed after bending in order to enable the bending back of the tooth brush body into its original shape. An independent claim is also included for a tooth brush with an end section.
