Abstract (en)

[origin: EP2347676A1] The structure (13a) has a coupling device coupling a spring element to a base support (14) and/or a support part (16). The spring element generates reset force in response to respective movement of the support part, where the reset force is directed opposite to the respective movement of the support part. The spring element is not coupled to the base support and/or support part when the coupling device is in a non-coupling state such that the spring element does not generate the reset force directed opposite to the respective movement of the support part.
