Abstract (en)
[origin: EP2348176A2] The locking device has a counter support (16) provided opposite to a locking element (12) operated in a prominent position, where the locking element is attached to a frame or a wing. The locking element is pivotably mounted from a lowered position into the prominent position around a swivel axis arranged parallel to a sliding direction of a connecting rod. An overlapping region of hooks (10, 10') and projections (11, 11') is larger than a clearance of the locking element or the hooks when compared to an opposing component in a direction of the connecting rod.
