Abstract (en)

[origin: WO2010045996A1] The invention relates to a method for controlling a processing machine (100) with driven axes (111', 112', 113', 114', 120', 121'), in particular a printing press (100), a radius (rA) of at least one axis (111', 112', 113', 114', 120', 121') being used to automatically determined the control threshold value. According to the invention, an actual radius and thus preferably the surface speed and the torque of the moving axis are automatically considered for the first time in order to control the speed.
