Abstract (en)
[origin: WO2010049393A2] The production of synthetic fuels (synfuel) is known in principle from the GTL (Gas To Liquid) process. It is proposed that a high-temperature electrolyzer be operated using a favorable energy source and to react the incident hydrogen gas with CO₂ catalytically. This will generate synthetic raw materials, in particular for the chemical industry as well as a fuel for motor vehicles. In addition to the generation of materials, the method is suitable for ensuring that CO₂ incident in many industrial processes which otherwise has negative global effects as a climate-damaging gas, is treated.
