Abstract (en)

[origin: WO2010043659A1] The invention relates to a data transfer, power supply and charging device, comprising a data interface that transfers energy to an energy storage medium as well as vehicle- or driver-specific data through a charging cable or electrical line. The use of a charging cable for the transfer of data to and from the vehicle is suitable for electrical and hybrid vehicles in the automotive field. In this manner, internal vehicle systems can be updated and examined. Furthermore, the data transfer, power supply and charging device can comprise a communications unit that also enables data to be received and transmitted during driving without an electrical connection having to be made.
