Abstract (en)
[origin: CA2745700A1] The invention relates to a method for producing a photovoltaic module having a plurality of solar cells which are connected in series. Said series connection comprises two connections. The connections of a plurality of series connections are combined into a connecting device. A plurality of homopolar connections are connected to each other by way of transverse contact wires. They are guided next to the solar cells over a carrier glass on the front side and beneath a film on the back side, wherein the film on the back side extends over the solar cells and the transverse contact wires. The transverse contact wires are bent together for greater thickness or folded away from the carrier glass on the front side and guided through cutouts in the film on the back side. Thus they protrude over said film on the back side for subsequent electrical connection.
