Abstract (en)

[origin: EP2353748A1] The method involves moving a section of an elongate work piece (120) e.g. wire and tube, by supply positions into an initial position in an engaging region of a bending head (130) by coordinated controlling of movements of machine axles of a bending machine in a bending process. The section of the work piece is deformed by bending using the bending head in a bending operation. A compensation movement avoiding vibration generation and/or removing vibration energy from a vibrating end section of a bent component is generated during a vibration-relevant movement in a compensation time interval. The bending machine is formed as a computer numerical control (CNC) bending machine and a single-head bending machine. Independent claims are also included for the following: (1) a device for manufacturing a bent component (2) a computer program product comprising instructions to perform a method for manufacturing a bent component.
