Abstract (en)

[origin: EP2354686A1] The outlet has an aperture (9) arranged to allow flow of supply air approximately in horizontal direction. A flat element (14) covers the outlet on an underside, and is arranged to be impermeable to air on the underside facing toward a room to be ventilated. Each outlet opening (13) is oriented in alignment with corresponding apertures such that the supply air flowing through each aperture is not deflected in an associated side chamber (7). The room air is induced by the flat element above an upper edge of the outlet in particular in an upper region of the outlet.
