Abstract (en)
[origin: EP2357295A1] The guard has a profile (3), a rod or a grid element, which are supported by arms (2) that are held perpendicular to a roof surface (C) of a roof. The arms are pivoted such that the arms take an active position, which is distant from the active area roof surface, to prevent sliding of snow layer in a direction of eave line. The arms takes a passive position, which lies at the roof surface, to promote spontaneous or provoked slipping of the snow layer, where the guard takes an intermediate positions to decelerate and stooping of sliding of the snow layer.
