Abstract (en)

A system server and access points are connected through a LAN on the ground. A control cycle is divided into an instruction time zone for providing instructions from the access points (8) to traveling vehicles (12), and a report time zone for providing reports from the traveling vehicles to the access points. The access points transmit target positions in the instruction time zone, and the traveling vehicles report positions in the report time zone. The system server determines target positions based on the reported positions.
