Abstract (en)
[origin: GB2432479A] A system for sending a data packet from a messaging device to a receiving device in a signalling network (210) is described. The system comprises a distributed service center (255) a message receiving service center (290), a plurality of signalling units (260, 270) for passing the data packet to the receiving device, a central routing logic (280) for routing the data packets and a closed network connecting at least the central routing logic (280) and the plurality of signalling units (260, 270). Also disclosed is a method for sending a data packet from a messaging device to a receiving device in an signalling network (210) which comprises the following steps: the data packet from the messaging device is passed to a message receiving service center (290); a central routing logic (280) connected to the message receiving service center (290) passes the message to one or more different ones of a plurality of signalling units (260, 270) which are connected to the central routing logic (280) by a closed network and the one or more signalling units (260, 270) pass the message to one or more hubs (300, 310).
