Abstract (en)

[origin: WO2010057592A1] The invention relates to a method for aligning a container (2) in relation to at least one geometric container feature in a set position, wherein an alignment of the container (2) is carried out by an analysis of actual image data in a control circuit (12) taken by means of an image recording device (8, 9, 10, 11). The actual image data is analysed in a region for evaluation by means of pattern recognition, which provided an actual position of the container as a result if the geometric container feature is recognised and displays if the feature has not been recognised. The invention further relates to a device for carrying out said method and a computer programme product to carry out all the steps of the method.
