Abstract (en)

[origin: EP2174891A1] The device (1) has a cylinder head (3) for sliding in a support ring (2), where the head comprises main opening (4) and secondary opening at two ends, respectively. A valve (8) has a rod sliding in the secondary opening. A compression unit associates the valve and the cylinder head, such that the device is not pressurized by a pressurizing unit, and a valve head closes injection openings by the compression unit. The valve rod slides in the secondary opening, such that the valve head does not close the injection openings, when the device is pressurized by the pressurizing unit. Independent claims are also included for the following: (1) a container for containing granular materials (2) a method for packaging the granular materials (3) a method for declogging of the granular materials in the container.
