Abstract (en)  
[origin: WO2010061063A1] The invention relates to a system of assembling storage means in the form of electrical energy modules (M1, M2), each having two pairs of positive and negative terminals (B11, B12; B21, B22), whereby: each of the pairs of positive and negative terminals (B11, B12; B21, B22) is distributed over at least one of the external faces of each module (M1, M2), thus forming a terminal strip of the module; at least one interconnection block (I1, I2) can be inserted onto part of each of the terminal strips of two separate modules and itself comprises at least two pairs of anchoring points (A1, A2; A3, A4) so as to form an assembly block, either by stacking said storage modules (M1, M2) or by juxtaposing same; and at least two anchoring points of each interconnection block are in electrical contact, while stiffening the assembly, in a manner complementary to the other anchoring points.
