Abstract (en)

[origin: EP2360302A1] A yarn layer (6) is produced by winding up the warp belt comprised with thread sheet to a warping drum (2). A handle (11) having a predetermined radial direction length projecting out of the yarn layer divides the yarn layer. A pressure roller (9) is made to abut the yarn layer when the yarn layer reaches the radial direction thickness which corresponds to the radial direction length of the handle. The warp belt is displaced at a preset displacement rate. The displacement rate is changed when the pressure roller abuts the yarn layer. An independent claim is included for sectional warping machine.
