Abstract (en)

[origin: EP2360323A1] The device (10) has a part made of a thermally insulating material i.e. polystyrene, and defining an end interjoist (11) in an upper part to take support on adjacent joists (2), at an end of a beam (T) opposite to a bearing element of a construction. An insulating wall (14) extends vertically under end interjoists on a predetermined height to partially cover the bearing element. The insulating wall comprising a structured sectile end zone (16) that is connected to a lateral covering zone (15) and forms a covering base below the bearing element when the bearing element is a joist.
