Abstract (en)

The digital audio broadcasting reception apparatus (100) which receives broadcasting waves generated by multiplexing audio services and data services including a broadcasting website (BWS) includes a display unit (7), a tuner (2), and a controller (5) which detects a reception state of a broadcasting signal being received. When a level of the reception state of the broadcasting signal becomes lower than a predetermined level, the controller (5) receives an ensemble which is different from an ensemble being broadcasting a BWS being received but which is broadcasting the same service and displays a page the same as a page being viewed in a display unit (7). The controller (5) stores information on the BWS page of the received data service in a storage unit (8), configures the same page with reference to the information on the BWS page, and outputs the page to a screen of the display unit (7).
