Abstract (en)
[origin: EP2362045A2] The door has a hinge body (30) fastened at a fold, which is provided at a long side of the door. A hinge (12) is inserted in the fold. A side of the fold pointing towards an inner side is provided with an opening. The opening corresponds with a cylindrical opening (32) in the body. The body includes a rod (36) at a longitudinal side lying at the fold so that tilting movement of the body around a centering pin and adjustment of the body relative to the door are carried out. A hinge pin (14) is longitudinally displaceably guided into the body so that the pin projects at a front side of the body.
