Abstract (en)

The sea hand paddle consists of a compact slightly flexible flat base as its main body (1), whereon is embedded a mesh or normal smooth elastic belt (2), in which the palm of the swimmer enters easily and steadily. The rear of the main body (1) ends up into an arm (3), at the two sides of which are embedded respectively two flexible semi-rings (4), in which is easily and steadily adjusted the forearm on the wrist of the swimmer. At the bottom surface of the main body (1) are the ribs (5), for the enhancement of the resistance to exerted pressure on the sea hand paddle. The sea hand paddle is an invention which helps swimmers of all ages to entertain themselves and enjoy swimming even more. It helps castaways to have better control of the situation, save necessary physical power for their survival and it helps lifeguards to reach even faster swimmers in danger. The sea hand paddle is lightweight, is placed and removed very easily and very fast in the hand of the swimmer.
