Abstract (en)

[origin: EP2364940A2] The method involves adjusting pressure plate providing elements (1, 2) i.e. trays, to each other. Pressure plates (42, 43) are isolated from a pressure plate stack (41) by an isolation device (50), where the pressure plate stack is provided in an access region of the isolation device. One of the plate providing elements is pivoted around a pivoting axis. The stack is brought into a removal position for isolating the pressure plates from the stack by the isolation device or into a rest position. The isolation device is provided in a direction to a processing device i.e. print plate-setter. An independent claim is also included for a device for preparing and transferring printing plates.
