Abstract (en)

[origin: WO2010059143A1] A method and system of virtual energy management display involves periodically receiving via a mesh local area network electronic data representing energy management-related information by a RF communication-enabled memory storage device coupled to an electronic display device within a home area network. Electronic data representing telemetry information is likewise periodically received by the RF communication-enabled memory storage device from at least one RF communication-enabled energy management-related device within the home area network. The electronic data is converted to a common format by an application running at least in part on the memory storage device and displayed on a screen associated with the display device.
