Abstract (en)
[origin: EP2366369A2] The module has a base unit receiving a patient stretcher (50), and a guiding path (51) enabling formation of an intermediate position between a patient supporting position and a patient receiving position, in a non-telescopic condition of the base unit. Change of inclination of the patient stretcher is achieved with respect to the patient supporting position in addition to a change in a horizontal position of the patient stretcher, in the patient receiving position. The patient supporting position is achieved from the intermediate position by telescopic movement of the base unit.
