Abstract (en)
[origin: EP2366817A1] Production of a package is improved by revising the arrangement of units constituting the spinning machine so that the units can be handled and maintained conveniently. A spinning machine (4) includes a draft process unit (12) for drawing a sliver (S), a pneumatic spinning unit (13) for twisting the sliver (S) and delivering a spun yarn (Y), and a winding unit (17) for winding the spun yarn (Y) and forming a package (P). A yarn path in a unit configuration section (8) where the units are disposed includes a first yarn path (R1) which is horizontal or inclined gently, and a second yarn path which continues from the first yarn path (R1) and is guided by a yarn-accumulating device (15) to a different direction from that of the first yarn path. The units are arranged along the first yarn path (R1) and second yarn path (R2).
