Abstract (en)

[origin: EP2367080A1] The movement has a control component e.g. push button (102), for allowing the selection of functional modes e.g. activation and deactivation modes, of the movement. Displaying units e.g. wheel and display disc, are coupled to the control component to display a current functional mode. An adjusting component e.g. crown (103), completes three different functions according to the current functional mode. The adjusting component allows the adjustment of two temporal parameters e.g. date triggering parameter (109') and a time triggering parameter (110'). An independent claim is also included for a method for controlling a clock movement.
