Abstract (en)

[origin: EP2367250A2] The box has a housing (11) opened upwards and provided with a base plate (19). Holding elements (12) are arranged at a lower side of the housing for fixing the box at a channel lower part. A clamping arm (20) is formed at the base plate and co-operates with a holding profile i.e. C-rail. The arm is axially movable from a mounting position into a locking position in a recess (16) of the base plate via a slider plate (30) that is movable in a longitudinal direction of the channel. The slider plate has a guiding hole (33), into which a guiding pin (13) is guided for movement of the arm.
