Abstract (en)

[origin: EP2368803A2] The labeling machine has a rotatable supporting plate (4) with a safety device (8) which is designed such that an access is barred between a defined bearing surface and a plate level with a rotating plate. The access is spaced from the plate level for changing the roll material of the defined bearing surface with a stationary pate. The plate has a star wheel which forms the bearing surface for the roll material. An independent claim is also included for a device for receiving a roll material.
