Abstract (en)

[origin: EP2369152A1] The device (6) has two connection points (11, 12) for fastening the device at a component (10) of an exhaust system (2) and at a periphery structure (7) of a vehicle, respectively. A coupling device (13) is arranged between the connection points, and enables reversible relative movement between the connection points. The coupling device exhibits speed-based and/or frequency-based rigidity in an effective direction such that the coupling device exhibits smaller rigidity during slow or low frequent relative movements than during fast or high frequent relative movements.
