Abstract (en)
[origin: EP2369173A2] The machine i.e. hydraulic motor (1), has a housing (2), and a shaft (3) guided in the housing and rotatable around an axis. The shaft forms a part of a movement section, and a sensor arrangement (10) has a transducer (12) and a receiver (15). A channel (21) is provided in the movement section, and the transducer is connected with a torque transmission element (19) i.e. speedometer shaft, that is guided to a section of the movement section through the channel, where the section of the movement section is removed far away from the transducer than a transducer-sided end of the movement section.
