Abstract (en)

[origin: WO2010070142A2] Method for merging information of high semantic level representing complex situations composed of several objects originating from several sensors c_i , said information possibly being heterogeneous, said method comprising the following steps: acquiring the various information emanating from said sensors in raw form and transforming it so as to convert it into the form of conceptual graphs, a conceptual graph representing several concepts and the relationships which exist between them, and being composed of entity nodes and of relationship nodes, with E the set of concept nodes defined on a support S , G_1 and G_2 two conceptual graphs defined on S , characterized in that the method determines a merging strategy denoted strategymerge as follows: $\text{strategymerge} = \text{fmerge?fcomp:E xE?E?}\{E xE\}$ where $\text{fmerge}:\{\text{true}, \text{false}\} \times E xE?E?\{E xE\}$ is a function for merging the concept nodes of the graphs, and $\text{fcomp}: E xE?\{\text{true}, \text{false}\} \times E xE$ is a function for testing compatibility between two concept nodes of the graphs, and in that the method comprises a step in the course of which said merging strategy is applied to the various information taking the form of the graphs.
