Abstract (en)
[origin: EP2372230A1] The plastering disk (100) has clips (135) on the upper side, where the clips protrude over the recessed inner lying area (120) in a partial manner, so that a projection engages in mounting condition behind the clips. The inner lying area is rebound opposite to the outer lying area (130) on the upper side, around which the projection is received. An independent claim is also included for a plastering device with a cylindrical area.
