Abstract (en)

[origin: WO2010066739A1] The invention relates to a device (10, 30, 40, 50, 60) for closing at least one thin-walled transporting container (12) which has at least one opening and is intended for items of value. The device (10, 30, 40, 50) has at least a first closure element (14) and a second closure element (16) spaced apart from the first closure element (14). The first closure element (14) comprises at least one first latching element (18a to 18c) and the second closure element (16) comprises at least one second latching element (20a to 20c), which complements the first latching element (18a to 18c). The first closure element (14) and the second closure element (16) are arranged such that at least part of the opening of the transporting container (12), this opening being open in order for the items of value to be supplied, can be arranged between the first closure element (14) and the second closure element (16), and a latching connection can be created between the first latching element (18a to 18c) and the second latching element (20a to 20c) by movement of at least one closure element (14, 16) with a part of the transporting container (12) which is arranged between the closure elements (14, 16). The invention also relates to a method for closing at least one thin-walled transporting container (12).
